CyberThreats Digital Surveillance

Anticipate, detect and respond to digital risks to safeguard your brand

O₂ **business**

Attacks from cyber criminals, hackers and hacktivists make headline news. This puts pressure on you and your business to consider the impact of a cyber attack. And then what to do about it.

Most businesses struggle to identify every threat and put preventative measures in place. With CyberThreats Digital Surveillance you can take action against these growing risks to your business. It monitors illegal activity across thousands of sources on the open Web as well as the Deep Web and the Dark Web. It gives you insights into the typical attacks in your industry. It checks the information on your selected executives and builds a risk profile about how these people could be targeted. Most importantly of all, it gives you ways to help prevent these threats from undermining your business.

With CyberThreats Digital Surveillance, you can reveal your true digital footprint. You can then tackle any threats head-on – taking down fraudulent sites, removing sensitive information and pulling the plug on fake content.

CyberThreats Digital Surveillance prevents business disruption

Protects your business at all times – by providing intelligence of potential hacktivism, security breaches, credentials theft and other attacks.

Anticipates sophisticated attacks – including online fraud such as phishing, pharming, malware, carding or suspicious mobile applications.

Covers the full threat lifecycle – from monitoring and analysis to mitigation such as browser blocking and resolution through take down and closure.

Reduces potential costs – by identifying and resolving potential attacks early on to limit the financial and reputational damage to your organisation.

Makes it easier to stay secure – with an online portal offering you a unified control point and central source for all attack information.

Take the fight to the cyber attackers

You can depend on our cyber intelligence-based technology for proactive detection and an agile response to cyber threats.

Global vision
Offers a detailed view of your organisation's security status.

Innovation
Aggregates your own research and expertise along with the best of the industry.

Anticipation
Continually gathers evidence, trends and threats to arm you 24/7 against security risks.

Intelligence
Applies actionable insights so you can prevent, detect and respond to new threats.

Efficiency
Offers a quick response and final resolution to limit the financial or reputational impact.

How does it work?

CyberThreats Digital Surveillance is a fully managed service that helps mitigate and eliminate external digital risks. We start by scouting data from public and private sources to understand the specific threats to your business. That data is turned into intelligence so we can detect the threats, contain them and then eradicate any attacks. This includes closing resources used to commit fraud against you, removing unauthorised content and shutting down fake websites.

Our modules address each phase of the threat lifecycle. That way you can fill any gaps in your existing security or use them all for end-to-end coverage. You also benefit from real-time notifications on the latest threats, reports via an online portal and 24/7 support from technical experts. We even provide a Local Analyst who can meet with you regularly to provide ongoing advice.

Why O$_2$?

We have more than 30 years' experience securing fixed and mobile networks. We're the UK's only CAS(T) government-certified mobile and WAN provider giving added peace of mind. We're also part of the Telefónica group which includes ElevenPaths – the original developers of CyberThreats Digital Surveillance.

From managed services such as CyberThreats Digital Surveillance to individual security solutions, our customers can rely on the O$_2$ Digital Defence security portfolio to protect their business. This includes:

Connectivity protection

Secure every connection: mobile, internet, wifi and WAN.

Endpoint protection

Delivering better device security. Protection from ransomware and emerging threats covering mobiles, Windows and Mac, servers, and virtual machines.

Perimeter protection

Designed to block malicious traffic at the network edge. Keeping non-compliant or infected devices off your network. Delivering secure web browsing.

Online protection

Safeguard your internet presence. Keep your websites and internet systems up and running so you can safeguard your brand and your revenues.

Cloud protection

Extending the security to the cloud. Safeguard your cloud data, and apply your network-based security policies to your cloud services to protect your users.

Monitor and response

React more quickly with 24/7 real-time monitoring. Remove the blind spots in your security visibility with expert support.
